### Sika – Your Partner

Since many decades Sika has been a reliable partner with waste water treatment plant contractors supplying products and systems on all continents. Sika has shown the industry we are a partner, they can trust. The products and systems used in new waste water treatment plants and retrofitted structures are thoroughly tested in Sika laboratories before being independently checked. Sika materials are further proven by long term site testing to withstand the harsh conditions in the real environment.
The fresh water available on the earth amounts to only 3% of the total water – the balance being saline water from seas and oceans. Rivers and lakes that supply most of the water for the human uses only constitute 0.007% of the total water (source: US geological survey, 2009). From these figures alone, it is clear that we should do the maximum to minimize pollution of our rivers and lakes. Waste water from urban and agricultural areas is one of the most significant sources of pollution. There is a wide diversity in the world regarding access to waste water treatment. While 90% of the waste water produced globally remains untreated, this situation is reversed in developed countries – for example, around the Lake Geneva, more than 95% of the population is connected to a sewage treatment plant. Sika contributes to saving water in the planet by providing sustainable construction and refurbishment solutions to extend the functional service life of waste water treatment plants.

**SIKA SOLUTIONS TO REDUCE WASTE!**

In a remedial work, significant amount of waste is generated: polluted concrete, chemical residue of old coatings, pails and bags. These wastes need to be disposed off in specific areas and contribute to CO$_2$ emission. Sika provides long-lasting repair and protection systems that help to extend the interval between maintenance and remedial work. Thanks to this, the quantity of waste is significantly reduced.

**THE SIKA LIFE CYCLE ASSESSMENT APPROACH**

Life Cycle Assessment (LCA) is a standardized method to assess and compare the inputs, outputs and potential environmental impacts of products and services over their life cycle. LCA’s are increasingly recognized as the best way to evaluate the sustainability of products and systems. Sika carries out LCA’s according to the ISO 14040 series and the Standard EN 15804. The impact assessment methodology used is CML 2001. The data for the Sika LCA is based on public databases, such as those from ecoinvent, the European Reference Life Cycle Database (ELCD) and PE-GaBi, plus the specific data from Sika production plants and products.

Cumulative Energy Demand (CED), Global Warming Potential (GWP) and Photochemical Ozone Creation Potential (POCP) are considered to be the most relevant for concrete repair and protection:

- **Cumulative Energy Demand (CED)** is the total amount of primary energy from renewable and non-renewable resources.
- **Global Warming Potential (GWP)** is the potential contribution to climate change due to greenhouse gases emissions.
- **Photochemical Ozone Creation Potential (POCP)** is the potential contribution to summer smog, related to ozone induced by sunlight on volatile organic compounds (VOC) and nitrous oxides (NOx).
SUSTAINABLE REFURBISHMENT OF WASTE WATER TREATMENT PLANTS

Sika LCA’s on refurbishment strategies for waste water treatment plants are based on a ‘Cradle to Grave’ approach. Potential environmental impact of products for concrete repair and protection is investigated from raw material extraction, production, application and use to final disposal at end of life.

Sikagard® state of the art concrete protection system with field proven durability allows 40 years of operation with only one short shut down period for refreshing the top coat.

### Biological tank
- **1000 m² exposed surface, reinforced concrete without initial protection.** First refurbishment after 20 years of use.

#### Scenario 1: Minimum investment
- Initial repair: Ultra high pressure water jetting, reinforcement corrosion protection and concrete repair
- Concrete protection: Polymer modified cementitious resurfacing mortar
- Life span based on field investigation: 7.5 years
- Life span for LCA: 20 years
- Refurbishment & refreshing (every cycle):
  - Ultra high pressure water jetting
  - Reinforcement corrosion protection
  - Concrete repair
  - Polymer modified cementitious resurfacing mortar

#### Scenario 2: Durable solutions
- Initial repair: Ultra high pressure water jetting, reinforcement corrosion protection and concrete repair
- Concrete protection: Sikagard®-720 EpoCem® Epoxy cement resurfacing mortar
- Sikagard®-63 N HIgh build epoxy coating
- Life span based on field investigation: 10 years
- Life span for LCA: 20 years
- Refurbishment & refreshing (every cycle):
  - Ultra high pressure water jetting
  - Reinforcement corrosion protection
  - Concrete repair
  - Polymer modified cementitious resurfacing mortar

### Construction and end-of-life scenario of the reinforced concrete structure itself is excluded.

### Two different scenarios of refurbishment are analyzed – see below:

### Biological tank
- **1000 m² exposed surface, reinforced concrete without initial protection.** First refurbishment after 20 years of use.

#### Scenario 1:
- Minimum investment
- Initial repair: Ultra high pressure water jetting, reinforcement corrosion protection and concrete repair
- Concrete protection: Polymer modified cementitious resurfacing mortar
- Life span based on field investigation: 7.5 years
- Life span for LCA: 20 years
- Refurbishment & refreshing (every cycle):
  - Ultra high pressure water jetting
  - Reinforcement corrosion protection
  - Concrete repair
  - Polymer modified cementitious resurfacing mortar

#### Scenario 2:
- Durable solutions
- Initial repair: Ultra high pressure water jetting, reinforcement corrosion protection and concrete repair
- Concrete protection: Sikagard®-720 EpoCem® Epoxy cement resurfacing mortar
- Sikagard®-63 N HIgh build epoxy coating
- Life span based on field investigation: 10 years
- Life span for LCA: 20 years
- Refurbishment & refreshing (every cycle):
  - Ultra high pressure water jetting
  - Reinforcement corrosion protection
  - Concrete repair
  - Polymer modified cementitious resurfacing mortar

### Even when using epoxy based materials to increase durability, scenario 2 has a slightly lower CED than scenario 1 due to its greater resource efficiency (lower material consumption over the whole life cycle). This is an equivalent saving of 550 liters of oil over the life cycle period (60 years).

### The greater resource efficiency of scenario 2 allows savings of 10 tons of CO₂ over the life cycle period (60 years). Comparing this value to the limit of the European Union strategy adopted in 2007 (not more than 130 g of CO₂ per km in 2015), this saving is equivalent to a car’s CO₂ emission during ~1,300 km per year.

### CONCLUSION
- Overall saving for the plant owner with positive incidence on sustainability.
- The appropriate strategy can have a beneficial impact:
  - by reducing the frequency of refurbishment cycles,
  - by improving the resource efficiency and the environmental performance of the refurbishment process,
  - by providing a more sustainable solution.
GENERAL PROCESS OF CLEANING
WASTE WATER

The cleaning procedure of a modern waste water treatment plant can be summarized in 6 different steps:

SEWER SYSTEM
see pages 10 – 13

Generally, waste water is collected and transported via a network of pipes and pumped to the waste water treatment plant.

MECHANICAL TREATMENT
see pages 24 to 29 and 38/39

This includes the screening to remove large objects in the sewage water and the whole sedimentation procedure as well. Sand and grits, oil, grease, fat, floating and heavy solids will be separated from the waste water. The primary sludge after settlement will be skimmed off.

Construction elements:
1 Screening channel
2 Grit removal chamber, combined with fat and grease removal
3 Primary sedimentation tanks
4 Secondary sedimentation plant

BIOLOGICAL TREATMENT
see pages 30/31

The pretreated waste water will be aerated in biological tanks. By adding oxygen, a special bacteria will be created to reduce the biodegradable soluble organic contaminants in the waste water.

Construction elements:
5 Aerated and anoxic biological tanks

CHEMICAL TREATMENT
see pages 30/31

The aim of the chemical treatment is to remove phosphorus by adding special chemicals as ferric chloride. This results in a chemical flocculation that will be removed further in the filtration process.

Construction elements:
5 Aerated and anoxic biological tanks

FILTRATION
see pages 36/37

All the remaining particles after the biological and chemical treatment will be retained in special sand filter beds. The cleaned water is discharged to the receiving environment.

Construction elements:
6 Filtration beds

SLUDGE TREATMENT
see pages 32 to 35 and 40/41

Sludge from the primary and secondary sedimentation will be digested to reduce the amount of organic matter. Within this process, biogas (methane, CO₂) will be produced and stored in gasometers. Afterwards, the digested sludge will be dewatered first, before it will be disposed into an incinerator or landfill.

In the energy building, methane gas will be used to produce electricity and heat.

Construction elements:
7 Digestion tanks
8 Gasometers
9 Energy building

This includes the screening to remove large objects in the sewage water and the whole sedimentation procedure as well. Sand and grits, oil, grease, fat, floating and heavy solids will be separated from the waste water. The primary sludge after settlement will be skimmed off.

Construction elements:
1 Screening channel
2 Grit removal chamber, combined with fat and grease removal
3 Primary sedimentation tanks
4 Secondary sedimentation plant
EXPOSURE FOR SEWERS

Most accessible sewers are more than 50 years old and in most cases are made of tamped or reinforced concrete in round, rectangular or ovoid shapes.

Generally, sewers present three different zones of stresses with specific issues:

A: Biogenic aggression, runoff, storm water, waste water or condensation
B: Runoff, storm and waste water, erosion and corrosion defects
C: Waste water, erosion and abrasion

1 Damages at the bottom:
Heavy abrasion and erosion of the concrete and prefabricated elements are often found at the bottom of the sewers. In general rules, these elements shall be replaced and reassembled properly by bonding them in place with an epoxy adhesive. In case of concrete substrate, the erosion can be repaired with a high abrasion resistant mortar that will increase the service life of the substrate.

2 Localized defects of the concrete:
Lateral walls and the crown often show localized defects of the concrete and sometimes defects due to the corrosion of the reinforcement. After appropriate preparation, these defects can be repaired using sulfate resistant repair mortars.

3 Full degradation of the concrete surface:
The resistance of tamped concrete against a strong water current is generally not enough and often the full surface of the concrete is eroded. It is recommended in these zones to proceed with a full resurfacing.

4 Cracks with water leaks:
Due to shrinkage or settlements, concrete in sewers often cracks. These cracks need to be filled in order to prevent leakage of pollutants to surrounding ground water. It is often necessary to use expanding materials to fill these cracks.

5 Damages at the crown:
Exposed tamped concrete surfaces show very low resistance against carbonation and the aggressive substances contained in the waste water. Therefore, these surfaces can be protected using EpoCem® technologies which are extremely resistant and watertight against urban waste water. At the crown area, the structure can be protected against condensation water using a hydrophobic impregnation. Additionally, the aerial part of the sewer can suffer from biogenic corrosion or microbial induced corrosion (MIC). To repair and protect these areas a 100% Calcium Aluminate Mortar must be used.
SIKA SOLUTIONS FOR SEWERS

The products and systems to repair sewers will vary according to the extent of damages, performance requirements, expected durability and budget. Sika can answer all the needs by offering products and system solutions to suit all requirements with the backup of worldwide references and experience.

**REPAIR WORK**

- Sika MonoTop®-910 N
  1-component anticorrosion slurry and bonding primer (when relevant)

- Sika MonoTop®-412 NFG
  1-component, polymer modified, sulphate resistant repair mortar

- Sika MonoTop®-2400 Reseaux
  1-component, sulphate resistant hydraulic repair mortar

- Sika MonoTop®-3400 Abraroc
  1-component, hydraulic abrasion resistant repair mortar, hand or dry spray applied

- Sika MonoTop®-4400 MIC
  1-component, 100% calcium aluminate, biogenic corrosion resistant repair and protection mortar

**SURFACE PROTECTION**

- Sikagard®-720 Epocem®
  Epoxy cement resurfacing mortar with high resistance against urban waste water

- Sikagard®-740 W/706 Thixo
  Hydrophobic impregnation to protect the concrete crown against condensed water

- Sika MonoTop®-4400 MIC
  1-component, 100% calcium aluminate, biogenic corrosion resistant repair and protection mortar

**ADHESIVE / ANCHORING / CRACK TREATMENT**

- Sikadur®-31
  Epoxy adhesive with high bonding on various substrates

- Sikadur®-311/314
  Fluid mortar for grouting of elements

- Sika AnchorFix®-5
  Xylenated polyester based
  2-component universal anchoring adhesive
  Multipurpose use in concrete

- Sika AnchorFix®-1
  Solvent and styrene free based, two-component polyester anchoring adhesive
  Multipurpose use in solid and hollow masonry and concrete, also for regulated applications

- Sika AnchorFix®-2+ / -2002 / -2020
  Solvent and styrene free, epoxy acrylate based, 2-component, high performance anchoring adhesive for different climate conditions
  Regulated / professional applications in concrete, fixing and post installed rebar applications in all classes of concrete

- Sika AnchorFix®-3+ / -3001 / -3020
  Solvent-free, thixotropic, 2-component, epoxy resin based, high performance anchoring adhesive
  Regulated / professional applications in concrete, fixing and post installed rebar applications in all classes of concrete also in cracked concrete
  High chemical resistance, extended Potlife. Can also be used in seismic zones, fire resistant tests available. Drinking Water certified

- Sika AnchorFix®-3001 / -3030
  Solvent-free, thixotropic, 2-component, epoxy resin based, high performance anchoring adhesive
  Regulated / professional applications in concrete, fixing and post installed rebar applications in all classes of concrete also in cracked concrete
  High chemical resistance, extended Potlife. Can also be used in seismic zones, fire resistant tests available. Drinking Water certified

- Sikadur®-Combiflex® SG
  System
  High performance joint and crack waterproofing system made of a FPO tape and epoxy adhesive

**INJECTIONS / FILLING**

- Sika® Injection-101 RC
  2-component expanding polyurethane foam to stop water leakage and temporary watertightness of cracks to allow further permanent injection

- Sika® Injection-201 CE
  2-component, elastic PUR resin for permanent and durable filling of the cracks, complying with EN 1504-5 as crack filling material for concrete (U(D1)W(2) (1/2/3) (9/30))

- Sikadur®-52
  2-component, fluid epoxy resin for structural injection of the cracks

- Sika® InjectoCem-190
  2-component, micro-cement injection

**FILLING (FLOOR)**

- SikaFix®-501
  Fast reacting, 2-component hybrid (organic and mineral) resin to fill cavities
PROBLEMS AND DAMAGES TO STRUCTURES

SCREENING CHANNELS
- Abrasion and erosion due to sand, grit or other heavy particles
- Chemical attacks due to aggressive waste or industrial water
- Leakage due to cracks, untight joints or damaged concrete
- Biogenic corrosion in covered channels due to the action of bacteria contained in the sewage

GRIT, FAT & GREASE CHAMBERS
- Abrasion and erosion due to sand, grit or other heavy particles
- Chemical attacks due to aggressive waste or industrial water
- Leakage due to cracks, untight joints or damaged concrete
- Biogenic corrosion in covered channels due to the action of bacteria contained in the sewage

PRIMARY SEDIMENTATION TANKS
- Chemical attacks due to aggressive waste or industrial water
- Leakage due to improper waterproofing
- Cracks due to thermal expansion or shrinkage
- Steel reinforcement corrosion due to low concrete cover
- Mechanical abrasion at the rolling pad

BIOLOGICAL TANKS
- Erosion due to water flow
- Chemical attacks due to aggressive waste or industrial water
- Leakage due to damaged waterproofing
- Cracks due to thermal expansion or shrinkage
- Steel reinforcement corrosion due to low concrete cover

GASOMETERS
- Steel corrosion
- Untight joints
- Sulfuric acid damages

DIGESTION TANKS
- Concrete damage due to sulfuric acid
- Leakage due to damaged waterproofing
- Cracks due to thermal expansion or shrinkage

SECONDARY SEDIMENTATION TANKS
- Abrasion due to sand
- Leakage due to damaged waterproofing
- Cracks due to thermal expansion or shrinkage
- Mechanical abrasion at the rolling pad

FILTRATION BEDS
- Leakage due to damaged waterproofing
- Cracks due to thermal expansion or shrinkage
AGGRESSIVE SUBSTANCES IN SEWAGE – SUSTAINED ATTACK ON CONCRETE

The type and extent of concrete damage to be expected in all areas of sewerage systems, is determined by the corrosiveness of the substances present, by the quality of the existing concrete and by the quality of any protective treatments. The level of concrete corrosiveness in the different parts of the sewerage system exposed to waste water can be assessed on the basis of EN 206: 2013. This European standard defines three levels of chemical attack (XA1, XA2 and XA3 – low, severe and very severe respectively) on concrete. The status of the water quality under this standard is however still an essential basis for selecting and applying suitable repair systems, all other relevant factors provided, such as MIC (microbial induced corrosion) are also carefully considered.

The repair system selection is of course also made on the basis of the concrete quality and in terms of the depth of damage, chloride levels and substrate strength etc. For very serious chemical attack, additional treatment in the form of a surface protection system is required, over and above the concrete repair and replacement. This so-called biogenic corrosion or microbial induced corrosion (MIC) is usually the most serious cause of damage in covered areas were there is turbulent sewage. Sulfuric acid can cause concrete erosion rates of 0.5 – 10.00 mm per annum, in extreme cases erosion of up to 20 mm has been measured.

MICROBIAL INDUCED CORROSION (MIC)

Danger in delay – Microbial Induced Corrosion (MIC)
The chemical composition of biogas consists mainly of methane and variable concentrations of carbon dioxide, water vapour, hydrogen sulfide, nitrogen, oxygen and hydrogen.

Microbial induced corrosion happens when sulphates in biological waste are converted into sulphides through a biological process under the anaerobic conditions below the waste-water line in the sewers. Above the waste-water line, the hydrogen sulphide gas that is released in this process forms aggressive and corrosive condensates with water such as sulfurous and then sulphuric acid.

SIKA SOLUTION
Sika MonoTop®-4400 MIC helps to increase the durability of structures in and along the sewerage system. Its key characteristics include:

- Acid neutralization, increasing durability of the concrete
- Promoting a bacteriostatic environment, stopping the bacterial production of acids

Sika MonoTop®-4400 MIC is particularly suited to the repair and refurbishment of sewerage system structures, including manholes, inspection galleries, lifting pits and stations, the main trunk sewers and other steel and concrete structures and pipes, etc. Sika MonoTop®-4400 MIC is produced using the unique 100% Calcium Aluminate Technology that has been developed and used since 1940 for the protection of sewerage and waste water systems worldwide.
Results of Experimental Testing of Protection Systems in an Aeration Tank

In 1991, in one of the largest sewage treatment plants in Europe, different coating systems were applied in an aeration tank and left in real life exposure. Investigations were carried out at various time intervals to assess the longterm performances of the installed coating systems.

Note: Full article available upon request

Cementitious mortars:
Because the sewage dissolves the cement paste, continuous erosion begins within a short period of time. The binder matrix is weakened and the aggregates then break away.

Polymer modified cementitious mortars:
They have a longer durability than normal cementitious mortars. However, when subject to aggressive chemical environments, their resistance is significantly reduced. When not over-coated, they can only provide protection for a short term.

Epoxy cement mortar:
The epoxy resin component improves the chemical resistance of the cement matrix. But due to the level of aggressiveness in waste treatment plant, they can only provide protection for a medium term.

Resin coatings:
According to their formulations, resin coatings (epoxy or polyurea) can bring long-term durability. However, particular attention must be paid to prevent osmotic blister by the use of EpoCem® leveling mortar as pre-treatment. Sikagard®-720 EpoCem® does not require curing and allows for a fast over-coating with a reactive resin. This allows a quicker and safer application process than normal cement render.
Before defining the repair and protection strategy, the specific sewage treatment plant requirements on refurbishment must be considered. These requirements can have an important influence in determining the correct design, planning and construction procedures, together with the future maintenance works necessary for the sewage treatment plant. Examples of these project related requirements are outlined below.

**DURABILITY**
Remedial works on a sewage water treatment plant can cause substantial costs; hence the frequency of remediation work should be as low as possible. Therefore, products used in these remedial works must provide adequate durability to extend the defined functional service life.

**DURATION OF CLOSURE / DOWN TIME**
During the time of remedial works, either the plant is completely or partly shut down leading to extra demand on neighboring plants. The remedial works selected shall minimize this duration of closure.

**SYSTEM COMPATIBILITY**
Remedial works on complex large sewage water treatment plants often demand a complete and integrated system build-up. The compatibility of products and system is very important. The use of one full range system supplier with proven compatible products and systems ensures this is achieved.

**TOTAL LIFE CYCLE COSTING**
The total costs must take into account the actual costs of the remedial works plus the maintenance costs of the defined functional service life. This significantly influences the selection of the appropriate refurbishment concept and the specific materials to be used.

**EXPOSURES / SITE CONDITIONS**
The specific site exposure and environmental conditions, such as the climate, access and space for material application, also significantly influences the selection of the refurbishment concept, the appropriate materials and application techniques.

**ECOLOGY**
Environmental friendly and sustainable materials such as solvent free products help to safeguard the environment. These are increasingly an important requirement. In some countries, some financial penalties are being imposed to contractors that use products that release Volatile Organic Compounds (VOC’s).

### General Sewage Treatment Plant Refurbishment Considerations

- **DURABILITY**: Remedial works on a sewage water treatment plant can cause substantial costs; hence the frequency of remediation work should be as low as possible. Therefore, products used in these remedial works must provide adequate durability to extend the defined functional service life.

- **DURATION OF CLOSURE / DOWN TIME**: During the time of remedial works, either the plant is completely or partly shut down leading to extra demand on neighboring plants. The remedial works selected shall minimize this duration of closure.

- **SYSTEM COMPATIBILITY**: Remedial works on complex large sewage water treatment plants often demand a complete and integrated system build-up. The compatibility of products and system is very important. The use of one full range system supplier with proven compatible products and systems ensures this is achieved.

- **TOTAL LIFE CYCLE COSTING**: The total costs must take into account the actual costs of the remedial works plus the maintenance costs of the defined functional service life. This significantly influences the selection of the appropriate refurbishment concept and the specific materials to be used.

- **EXPOSURES / SITE CONDITIONS**: The specific site exposure and environmental conditions, such as the climate, access and space for material application, also significantly influences the selection of the refurbishment concept, the appropriate materials and application techniques.

- **ECOLOGY**: Environmental friendly and sustainable materials such as solvent free products help to safeguard the environment. These are increasingly an important requirement. In some countries, some financial penalties are being imposed to contractors that use products that release Volatile Organic Compounds (VOC’s).

### General Sewage Treatment Plant Refurbishment Procedures

The repair and protection of sewage treatment plants must always be executed according to all relevant local standards and regulations. After a detailed condition survey and root cause analysis, the right procedures for successful refurbishment can be defined. Standards (such as European Standard EN 1504-9) define principles and methods to refurbish damaged concrete. Please refer to our Brochure “The Repair and Protection of Reinforced Concrete with Sika” for more information relating to repair and protection according to EN 1504-9.

OVERVIEW OF SIKA SOLUTIONS FOR EACH STRUCTURE

SCREENING CHANNELS

- Abrasion and erosion: Sika MonoTop®-3400 Abraroc
- Chemical attacks: Sikagard®-720 EpoCem® + Sika® Poxitar F (or Sikagard®-63 N)
- Cracks, untight joints: Sikadur-Combiflex® SG or Sikaflex® PRO-3
- Microbial induced corrosion (MIC) in covered areas: Sika MonoTop®-4400 MIC

GASOMETERS

- Steel corrosion: Sika® Icosit® 6630 System or SikaCor® EG System
- Steel joint: Sikaflex® TS Plus
- Sulfuric acid attack: Sika® Permacor® 3326 EG H or Sikalastic®-844 XT or Sikalastic®-8440

DIGESTION TANKS

- Sulfuric acid attack and waterproofing: Sika® Permacor® 3326 EG H or Sikalastic®-844 XT / -8440
- Cracks: Sikadur-Combiflex® SG
- Chemical resistant joint: Sikaflex® PRO-3

GRIT, FAT & GREASE CHAMBERS

- Abrasion and erosion: Sika MonoTop®-3400 Abraroc
- Chemical attacks: Sikagard®-720 EpoCem® + Sika® Poxitar F (or Sikagard®-63 N)
- Cracks, untight joints: Sikadur-Combiflex® SG or Sikaflex® PRO-3
- Microbial induced corrosion (MIC) in covered areas: Sika MonoTop®-4400 MIC

PRIMARY SEDIMENTATION TANKS

- Chemical attacks and damaged waterproofing: Sikagard®-720 EpoCem® + Sika® Poxitar F (or Sikagard®-63 N)
- Cracks, untight joints: Sikadur-Combiflex® SG or Sikaflex® PRO-3
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFG, SikaTop® Armatec®-110 EpoCem®, Sika MonoTop®-2400 Reseaux
- Mechanical abrasion: Sikadur®-42 or Sika® Icosit®-KC 330 FK

SECONDARY SEDIMENTATION TANKS

- Chemical attacks and damaged waterproofing: Sikagard®-720 EpoCem® + Sika® Poxitar F (or Sikagard®-63 N)
- Cracks, untight joints: Sikadur-Combiflex® SG or Sikaflex® PRO-3
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFG, SikaTop® Armatec®-110 EpoCem®, Sika MonoTop®-2400 Reseaux

BIOLOGICAL TANKS

- Chemical attacks and damaged waterproofing: Sikagard®-720 EpoCem® + Sika® Poxitar F (or Sikagard®-63 N)
- Cracks, untight joints: Sikadur-Combiflex® SG or Sikaflex® PRO-3
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFG, SikaTop® Armatec®-110 EpoCem®, Sika MonoTop®-2400 Reseaux

- Abrasion: Sika MonoTop®-3400 Abraroc
- Damaged waterproofing: Sikagard®-720 EpoCem®
- Cracks: Sikadur-Combiflex® SG or Sikaflex® PRO-3

- Damaged waterproofing: Sikagard®-720 EpoCem®
- Cracks: Sikadur-Combiflex® SG or Sikaflex® PRO-3
GENERAL DESCRIPTION & MAIN REQUIREMENTS
In a large treatment plant, the removal of large objects is automatically performed in the screening channel.

Typical problems encountered are:
- Abrasion and erosion due to sand, grit or other particles.
- Chemical attacks, depending on the aggressiveness of the waste or industrial water.
- Leakage and risk of pollution due to cracks, untight joints or damaged concrete.
- Damage in concrete due to microbial induced corrosion (MIC) in covered areas where the sewage is in turbulent flow.

SIKA SOLUTIONS FOR HYDRAULIC ABRASION
In waste water treatment plants, erosion is mainly due to abrasion or by chemical attack. Erosion damage results from the abrasive effect of water-borne silt, sand, gravel, and other debris being circulated over a concrete surface during operation. The compounds present in hardened Portland cement are attacked by the aggressiveness (low pH) of the waste water. Sika is specialized in this field since decades and, together with major partners, has developed products that address the issues above:

Sika MonoTop®-3400 Abraroc
- Hydraulic abrasion resistant mortar
- Sulfate resistant
- Mild acid resistant
- Spray applied

SIKA SOLUTIONS FOR SCREENING CHANNELS
TYPICAL DETAIL

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:
- Chemical attacks:
  - Sikagard®-720 EpoCem® and Sika® Poetar F (or Sikagard®-63 N)
- Cracks, untight joints:
  - Sikadur-Combiflex® SG or Sikafl ex® PRO-3
- Damaged concrete and steel reinforcement corrosion:
  - Sika MonoTop®-412 NFG
  - SikaTop® Armatec®-110 EpoCem®
  - Sika MonoTop®-2400 Reseaux
SIKA SOLUTIONS FOR GRIT, FAT AND GREASE CHAMBERS

GENERAL DESCRIPTION & MAIN REQUIREMENTS
In some plants, pre-treatment may include a grit channel where the waste water velocity is adjusted to allow settlement of the sands/grits or other hard particles. Sands/grits must be removed as they may damage pumps or other equipments. Fat and grease removal is generally done in large plant in the primary settlement tank using mechanical surface skimmers.

Typical problems encountered are:
- Abrasion and erosion due to sand, grit or other particles.
- Chemical attacks depending on the aggressiveness of the waste or industrial water.
- Leakage and risk of pollution due to cracks, untight joints or damaged concrete.
- Microbial induced corrosion (MIC) in covered areas where the sewage is in a turbulent flow.

SIKA SOLUTIONS FOR UNTIGHT JOINTS
Very often in waste water treatment, joints sealed with average sealant fail due to the lack of chemical resistance of these products. Instead of proceeding to the full removal of the failed joint, Sika has developed joint system that can be applied over the original failed material. The Sikadur-Combiflex® SC system is the second generation development of the globally proven Sikadur-Combiflex® with even improved performance such as advanced adhesion properties. The unique system consists of the Sikadur-Combiflex® SC tape and the Sikadur® adhesives. It is widely used as joint waterproofing in watertight concrete structures.

Advantages:
- Repair of failed joint
- Blocking the path of water penetration
- Increased length of water penetration
- Fully bonded to the concrete preventing underflow
- Waterproofing of joints with extreme movements
- Easy to install and adjust to complicated construction details
- Excellent adhesion to different substrates
- Resistant to high water pressure
- Crack sealing system
- Easy to control and repair

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:
- Abrasion and erosion:
  - Sika MonoTop®-3400 Abraroc
- Chemical attacks (fatty acid):
  - Sikagard®-720 EpoCem® and Sikagard®-63 N
- Damaged concrete and steel reinforcement corrosion:
  - Sika MonoTop®-412 NFG
  - SikaTop® Armatec®-710 EpoCem®
  - Sika MonoTop®-2400 Reseaux
- Microbial induced corrosion in covered areas with turbulent flow in the sewage:
  - Sika MonoTop®-4400 MIC
GENERAL DESCRIPTION & MAIN REQUIREMENTS

In the primary sedimentation tank, sewage flows through large tanks, commonly named “primary clarifiers” or “primary sedimentation tanks”. These tanks are equipped with mechanically driven scrapers that drive the collected sludge towards a hopper.

Typical problems encountered in these tanks are:

- Abrasion and erosion due to sand, grit or other particles.
- Heavy abrasion on the rolling pad of the scraper.
- Chemical attacks depending on the aggressiveness of the waste or industrial water.
- Leakage and risk of pollution due to cracks, untight joints or damaged concrete.

SIKA SOLUTIONS FOR ABRASION RESISTANT GROUT

Mechanical scraper movement yields to heavy stress combining vibration and abrasion. Although cost effective, cement based products do not resist much against stress from vibration of the scraper and therefore do not last long.

Sika proposes for this usage either epoxy or PU based grout / adhesive to fix the metallic rolling cladding on the running surface of the scraper.

Sikadur®-42 HE
- 3-pack epoxy grout
- High early strength and fast curing
- Stress and impact resistant
- High vibration resistance

Sika® Icosit® KC 330 FK
- 2-pack, solvent-free polyurethane adhesive
- High initial adhesion
- Vibration reducing
- Noise absorbing
- Not requiring temporary fixation

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:

- Chemical attacks and improper waterproofing: Sikagard®-720 EpoCem® and Sika® Poxitar F (or Sikagard®-63 N)
- Cracks, untight joints: Sikadur-Combiflex® SG or Sikaflex® PRO-3
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFG, SikaTop® Armatec®-110 EpoCem®, Sika MonoTop®-2400 Reseaux
- External concrete protection: Sikagard®-740 W hydrophobic impregnation, Sikagard®-675 W ElastoColor protective coating

TYPICAL DETAIL

1. Concrete wall of clarifier
2. Ground level
3. Water level within the clarifier
4. V2A Stainless steel plate
5. Priming of concrete surface with Primer such as Sika® Icosit® KC 330 Primer or equivalent
6. Shock absorbing, vibration damping & bonding material such as Sika® Icosit® KC 330 FK
7. Priming after grinding the underside of the stainless steel plate with primer such as Sika® Icosit® KC Primer or equivalent
8. Scraper bridge
SIKA SOLUTIONS FOR BIOLOGICAL TANKS

GENERAL DESCRIPTION & MAIN REQUIREMENTS

Primary sedimentation tanks are designed to substantially degrade the biological content of the sewage. These biological contents are originated from human waste, soap and detergents.

Typical problems encountered in these tanks are:
- Chemical attacks depending on the aggressiveness of the waste or industrial water.
- Leakage and risk of pollution due to cracks, untight joints or bad quality concrete.
- Concrete spalling due to reinforcement steel corrosion.

SIKA SOLUTIONS FOR CONCRETE REPAIR

Overview

Repairing damaged concrete is one of the primary requirements in the maintenance of sewage treatment plants. A sound and correctly repaired concrete substrate is also the basic requirement for any additional waterproofing, protection or strengthening systems to be applied.

Requirements

- Full system compatibility (bonding primer, repair mortar, levelling mortar)
- Approved for structural repairs where required (e.g. class R3 or R4 according to EN 1504-3)
- Low crack sensitivity
- Fast and easy application

SIKA SOLUTIONS

- Bonding primer for large area repairs (where relevant): SikaTop® Armatec®-910 EpoCem®
- Reinforcement steel bar corrosion protection: SikaTop® Armatec®-910 EpoCem®
- Semi-fluid repolishing mortars for large area repairs: Sika MonoTop®-452 N
- Thixotropic repolishing mortars for local patch repairs: Sika MonoTop®-422 N/ S/ NFC/ SFG; Sika MonoTop®-2400 Réseaux
- Surface levelling and smoothing mortars: Sika MonoTop®-620 or Sika MonoTop®-723 N (normal performance) or SikaGard®-720 EpoCem® (high performance)
- Self-levelling, epoxy modified, cement based levelling mortars: SikaFloor®-411-82 EpoCem®
- Highly resistant to hydraulic abrasion cement based mortar: Sika MonoTop®-3400 Abraroc
- Surface levelling and smoothing mortars: Sika MonoTop®-620 or Sika MonoTop®-723 N (normal performance) or SikaGard®-720 EpoCem® (high performance)
- Self-levelling, epoxy modified, cement based levelling mortars: SikaFloor®-411-82 EpoCem®
- Highly resistant to hydraulic abrasion cement based mortar: Sika MonoTop®-3400 Abraroc

SIKA concrete repair expertise

Sika provides an extensive range of thoroughly tested and proven repair materials and systems based on different technologies for each specific requirement and situation.
SIKA SOLUTIONS FOR GASOMETER

GENERAL DESCRIPTION & MAIN REQUIREMENTS
Within the process of biological deterioration in the biological tank or the digestion tank, biogas (methane, CO₂) will be produced and be stored in gasometers. These gasometers are generally built in steel. Biogenic sulfuric acid is highly aggressive to steel. Additional stresses are caused by the elevated temperature.

Typical problems encountered are:
- Steel corrosion
- Leakage and risk of pollution due to untight joints

SIKA SOLUTIONS FOR STEEL CORROSION
Sika provides a large range of extensively tested products in the field of corrosion protection. Sika offers products for the protection of new structures on site or for shop application. For maintenance works, Sika offers a surface tolerant primer allowing application of the corrosion protection without sandblasting the surface, meaning no plant shut down is necessary. UV-resistant top coats, available in almost all RAL color shades, give the possibility for aesthetic designs.

SIKA SOLUTIONS FOR DIGESTERS, GASOMETER AND MIC (MICROBIAL INDUCED CORROSION) OF STEEL STRUCTURES IN ANAEROBIC CONDITIONS
- Hot spray Polyurea, solvent free, crack bridging, highest chemical resistance, 1 layer application: Sikalastic®-844 XT or Sikalastic®-8440, on primer SikaCor® EG 1 (on steel)
- High performance epoxy resin, solvent based, 3 layer application: Sika Permacor®-3326 EG H, directly applied on blasted steel

SIKA SOLUTIONS FOR STEEL COMPONENTS
Steel, not subject to microbial induced corrosion:
- Standard epoxy, solvent free, high chemical resistance, 3 layer application Sikagard®-63 N
- Epoxy, anthracene oil based, high solid Sika® Poxitar F

SIKA SOLUTIONS FOR STRUCTURAL STEEL WORK
Coating systems for structural steel have to fulfill the requirements in accordance to EN ISO 12944:
- System build-up for corrosive industrial and maritime climate based on 2-comp. products SikaCor® EG-System
- System build-up for maintenance: Sika® Poxicolor Primer HE

SIKA SOLUTIONS FOR GASOMETER

TYPICAL DETAIL
1 Steel plates
2 Bolt with protection
3 Sikaflex® TS Plus

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:
- Steel plate joint: Sikaflex® TS Plus
- External weathering protection:
  Concrete structures:
  Sikagard®-740 W, Sikagard®-675 W ElastoColor
  Brick structures:
  Sikagard®-703 W

SIKA SOLUTIONS FOR GASOMETER
SIKA SOLUTIONS FOR DIGESTION TANKS

GENERAL DESCRIPTION & MAIN REQUIREMENTS

The sewage sludge digestion tank is where the sludge is stabilized, reduced in volume, made innocuous through the process of dissolving organic substance with the help of anaerobic bacteria and finally, where energy is recovered.

Typical problems encountered are:
- Heavy chemical attacks above the anaerobic zones
- Leakage and risk of pollution due to cracks, untight joints or damaged concrete.

SIKA SOLUTIONS FOR HEAVY CHEMICAL PROTECTION

Concrete or steel above the sludge may suffer heavy attack due to the formation of the sulfuric acid (refer to page 16 for more details). Additional stress is caused by the elevated temperature originating from the biological process. Down times always create problems and difficulties for the owners, as well as loss of money. Sika offers solvent free, high build coating systems which can be applied in one layer on a good prepared surface. Therefore, down times can be minimized without the reduction of the protective properties.

- Sikalastic®-844 XT or Sikalastic®-8440 on primer
- Sikafl oor®-156/-161 on concrete or SikaCor® EG-1 on steel
  - Hot spray Polyurea
  - Solvent free
  - Crack bridging
  - Highest chemical resistance
  - 1 layer application

- Sika Permacor®-3326 EG H
  - High performance epoxy resin
  - Solvent based
  - 3 layer application

SIKA SOLUTIONS FOR REFURBISHMENT

SIKA TECHNOLOGIES AND SOLUTIONS FOR SEWERS WASTE WATER TREATMENT PLANTS

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:

- Cracks, untight joints: Sikadur-Combiflex® SG, Sikafl ex® PRO-3, Sikafl ex® TS Plus
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFC, SikaTop® Armatec®-71D EpoCem®, Sika MonoTop®-240D Reseaux
- External concrete protection: Sikagard®-740 W hydrophobic impregnation, Sikagard®-675 W ElastoColor protective coating

TYPICAL DETAIL

1 Concrete
2 Cracks
3 Primer Sikafl oor®-156/-161 lightly broadcasted with quartz sand 0.3 – 0.8 mm
4 × Sikalastic®-844 XT
SIKA SOLUTIONS FOR SECONDARY SEDIMENTATION TANKS

GENERAL DESCRIPTION & MAIN REQUIREMENTS

Secondary treatment is intended to degrade further the organic content of sewage water originating from human waste, soap, detergent, etc. Most of the plants treat the sewage using aerobic biological processes.

Typical problems encountered are:
- Erosion due to water flow
- Chemical attacks, depending on the aggressiveness of the waste water
- Leakage and risk of pollution due to cracks, untight joints or damaged concrete
- Steel reinforcement corrosion due to reduced concrete cover

SIKA SOLUTIONS FOR DURABLE JOINT SEALANTS

Sealants used in sewage treatment plants have to survive extremely harsh conditions and thus must meet very demanding requirements.

SiKaflex® PRO-3
- 1-component non-sag sealant
- High resistance against waste water and waste water treatment chemicals
- Excellent adhesion under permanent water immersion
- Resistance against microbiological attack
- Resistance against continuous high water pressure

Approvals & standards
- ISO 11600 25 HM, EN 15651, part 4 25 HM CC
- CSM: Very good resistance against mould and bacteria growth according to IPA (ISO 846)
- Waste water resistance according to the DIBt guidelines (German approval body for construction products and types of construction)

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:

- Chemical attacks and improper waterproofing: Sikagard®-720 EpoCem® and Sika® Poxitar F
- Cracks, untight joints: Sikadur-Combiflex®, SiKaflex® PRO-3, SiKaflex® TS Plus for Steel
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFC, SikaTop® Armatec®-110 EpoCem®
  Sika MonoTop®-240D Reseaux

TYPICAL DETAIL

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:

- Chemical attacks and improper waterproofing: Sikagard®-720 EpoCem® and Sika® Poxitar F
- Cracks, untight joints: Sikadur-Combiflex®, SiKaflex® PRO-3, SiKaflex® TS Plus for Steel
- Damaged concrete and steel reinforcement corrosion: Sika MonoTop®-412 NFC, SikaTop® Armatec®-110 EpoCem®
  Sika MonoTop®-240D Reseaux
GENERAL DESCRIPTION & MAIN REQUIREMENTS
In the filtration bed, the treated water flows through various layers of sand beds for final filtration before being discharged in the environment.
Filters are periodically cleaned using air and clean water at counter stream. The cleansing water is then pumped back to the aeration basin for retreatment.

Typical problems encountered are:
- Abrasion
- Damaged waterproofing
- Leakage and risk of pollution due to cracks and untight joints

SIKA SOLUTIONS FOR BLISTERING
Typical problems occurring in sewage treatment plants are the formation of blisters (see picture on page 37) when semi-permeable coatings are applied in water saturated concrete. This can be avoided using a layer of 3 mm of Sikagard®-720 EpoCem® during the repair works. This specially developed product acts as temporary moisture barrier allowing the application of a coating or flooring to a green or damp concrete. The advantage for the owner is reduced completion time and eliminated risk of blistering.

Other characteristics of Sikagard®-720 EpoCem® are:
- Internal curing – no curing required
- Quick over-coating with resin coatings – either water or solvent based
- Increased chemical resistance (compared to polymer modified cement based product)
SIKA SOLUTIONS FOR TECHNICAL SERVICE BUILDINGS AND WEATHERING PROTECTION

GENERAL DESCRIPTION & MAIN REQUIREMENTS
Most waste water treatment plants have a technical service building. External surfaces of the building as well as of the above ground tanks are exposed to weathering and therefore often need protection.

In these technical buildings, chemicals are handled. Therefore, the floors in the chemical storage area also need protection.

SIKA SOLUTION FOR FLOORS
- Epoxy flooring, self-leveling, solvent free, high chemical resistance:
  Sikafloor®- 381
- PU-modified cementitious flooring, solvent free, excellent chemical resistance, lightly slip resistant:
  Sikafloor®- 21 PurCem

SIKA SOLUTIONS FOR EXTERNAL SURFACE PROTECTION
- Surface applied corrosion inhibitor:
  Sika® FerroGard®-933 Plus
- Thixotropic hydrophobic impregnation for concrete:
  Sikagard®-703 Thixo
- Hydrophobic impregnation for concrete:
  Sikagard®-740 W
- Hydrophobic impregnation for bricks and other mineral substrates:
  Sikagard®-703 W
- Concrete protective coating:
  Sikagard®-675 W ElastoColor
- Crack bridging concrete protective coating:
  Sikagard®-550 W Elastic

SIKA SOLUTION FOR FLOODS
- Epoxy flooring, self-leveling, solvent free, high chemical resistance:
  Sikafloor®- 381
- PU-modified cementitious flooring, solvent free, excellent chemical resistance, lightly slip resistant:
  Sikafloor®- 21 PurCem

SIKA SOLUTIONS FOR EXTERNAL SURFACE PROTECTION
- Surface applied corrosion inhibitor:
  Sika® FerroGard®-933 Plus
- Thixotropic hydrophobic impregnation for concrete:
  Sikagard®-703 Thixo
- Hydrophobic impregnation for concrete:
  Sikagard®-740 W
- Hydrophobic impregnation for bricks and other mineral substrates:
  Sikagard®-703 W
- Concrete protective coating:
  Sikagard®-675 W ElastoColor
- Crack bridging concrete protective coating:
  Sikagard®-550 W Elastic

OTHER TYPICAL PROBLEMS AND SIKA SOLUTIONS:
- Roofs in the buildings (technical and office) of the sewage treatment plants may require waterproofing. Sika offers full range of roof waterproofing that fits the different needs of owner:
  - SikaPlan® PVC or FPO membrane
  - Sikalastic® liquid applied membrane
SIKA SOLUTIONS FOR NEW CONSTRUCTIONS

CONCRETE FOR SEWAGE AND WASTE WATER TREATMENT PLANTS

Reinforced concrete forms the load-bearing framework, floors and walls for practically all of the specialist structures in sewage and waste water treatment plants. These include all of the drainage channels and pipework into the plant and between the different processes including initial mechanical screening and separation, primary sedimentation tanks, secondary treatment including clarification in aeration/biological digestion tanks, and finally any tertiary specialist chemical treatments and purification that are required.

High performance durable concretes must be used for these structures, particularly for direct contact with the sewage and waste water. However, it should be clearly understood that concrete alone cannot withstand all of the different types and degrees of mechanical and chemical attack that can be imposed in a waste water treatment plant. The correct design and construction of these structures, together with the additional surface protection systems required, are therefore all essential for long-term durability. Timely scheduled and correct maintenance are essential.

The main technical challenge for concrete is to resist in this harsh physical and chemical environment.

Concrete Corrosion & Erosion:
- Mechanical abrasion & erosion
- Freeze-thaw attack, with or without de-icing salts
- Chemical attack (acid and sulfate attack)
- Alkali-aggregate reaction (ASR)
- Microbial Induced Corrosion (MIC) in closed areas

Depending on the degree of exposure, the concrete can be designed and placed to provide increased levels of resistance, or this level can be further increased by the application of a suitable protective surface treatment. The so-called ‘tidal zones’ of tanks and structures which are areas continuously alternating between dry and wet exposure due to variations in water levels, are particularly at risk. In these zones, the damage processes can be accelerated by the alternating high oxygen and high water/chemical exposure. Over time, in some structures an organic “protective barrier layer” is formed on the concrete surfaces; however, each time this layer is removed by the cleaning scrapers, the concrete surface can also be abraded and is gradually eroded. The operation of the plant must therefore be optimized to minimize damage from this process.

Where the concrete surfaces are to be exposed, it is always important to pour and place the concrete as dense as possible, with minimal voids or surface cracking; plus:
- High ASR resistance is achieved through modifying the cement binder by adding suitable quantities of pulverized fly ash (PFA), or ground-granulated-blast-furnace-slag (GGBFS).
- Increased resistance to freeze-thaw action is obtained by adding air entraining agents.
- High resistance to mechanical impact and abrasion is achieved using a low water/cement ratio and added silica fume.
- Chemical resistance is related to the impermeability and density of the surface and the cement matrix, so a low w/c ratio and closed finish is necessary. However, against aggressive chemicals, particularly strong acid attack, the resistance of concrete alone is limited. Therefore, an additional protective surface treatment must be applied.

Acidic attacks which dissolve calcium compounds out of the hardened cement matrix can be caused by acids, exchangeable salts, vegetable and animal fats or oils. Degradation of the concrete usually occurs very slowly. (Picture: BetonSuisse, Merkblatt 01)

Sulfate driven attack is primarily caused by sulfates dissolved in water. By reacting with the hardened cement matrix, an increase in volume is induced, which damages the structure. (Picture: BetonSuisse, Merkblatt 01)

TYPICAL DETAIL

No matter how good a concrete is, the failure will occur at points of weakness: construction joints, cold joints and expansion joints, pipe penetrations, fixing, etc. Since decades, Sika provides a wide range of solutions to cater for all types of detailing: Sika® Waterbar for construction and expansion joints; Sikaflex® PRO-9, a chemical resistant joint sealant; Sikafuko® Hose, re-injectable hoses for construction joints; Sikadur-Combitrix® 5G System, for sealing construction joints, failed sealants, cracks etc.
MORE SIKA SOLUTIONS

GENERAL DESCRIPTION & MAIN REQUIREMENTS
Additionally to the different problems exposed in the previous pages, sometimes special issues are raised such as strengthening of a basin, anchoring some ladders in a tank, making an opening for a new pipe, waterproofing the flat roof of a new building, etc. Sika provides fully compatible products and integrated systems to suit almost every refurbishment project and site requirement.

SIKA SOLUTIONS FOR STRUCTURAL STRENGTHENING
Due to design errors, upgrading of a structure or damage of the concrete substrate, structural strengthening may be necessary. Bonding of strengthening products to an existing structure can extend its lifetime significantly avoiding demolition and rebuilding. Structural strengthening by bonding of external plates or lamination of fabrics is carried out in accordance with relevant design codes. The surfaces where the externally bonded reinforcement will be installed must be prepared and cleaned thoroughly. Any damages or deteriorated concrete must be removed and repaired to comply with EN 1504 part 10 section 7.2.4 and section 8. Depending on the project, different solutions are available:

Sika CarboDur® plates
- Pre-cured CFRP plates
- Bonded with Sikadur®-30 adhesive
- Light weight and easy to install, especially overhead
- Very high strength
- Excellent durability and fatigue resistance
- Minimal preparation, applicable in several layers
- Can alternatively be embedded into the substrate

SikaWrap® Fabrics
Dry fibre fabrics, saturated on site
Laminated with Sikadur®-330 or Sikadur®-320 resin
- Available in different weights and widths
- Flexible and accommodating of different surface planes and geometry
- Multifunctional material for use in different strengthening applications

Sika CarboStress® System
Unique pre-stressed strengthening system
Advantages of Sika CarboDur® CFRP plates
Advantages of post tensioning
StressHead anchorage system

Others:
CarboShear L: Profiles for shear strengthening of beams
CarboHeater: Accelerated curing of Sikadur®-30 adhesive

SIKA SOLUTIONS FOR GROUTING
SikaGrout®-334
- High performance shrinkage compensated cementitious grout
- CE marked as EN 1504-6, anchoring of reinforcement bars
- Low shrinkage, high mechanical strength
- Grouting under base plates, machine bases etc.
- Fast strength development
- Possible to reach up to 125 mm thickness per layer
- Sulphate resistant

SIKA SOLUTIONS FOR ANCHORING
Sika AnchorFix®-1
- Solvent and styrene free based, two-component polyester anchoring adhesive
- Multipurpose use in solid and hollow masonry and concrete, also for regulated applications

Sika AnchorFix®-2+ / -2002 / -2020
- Solvent and styrene free, epoxy acrylate based, 2-component high performance anchoring adhesive for different climate conditions
- Regulated / professional applications in concrete, fixing and post installed rebar applications in all classes of concrete; also in cracked concrete
- Drinking Water certified

Sika AnchorFix®-3+
- Solvent-free, thixotropic, 2-component, epoxy resin based, high performance anchoring adhesive
- Regulated applications in concrete, high chemical resistance, extended Potlife

Sika AnchorFix®-3001 / -3030
- Solvent-free, thixotropic, 2-component, epoxy resin based, high performance anchoring adhesive
- Regulated / professional applications in concrete, fixing and post installed rebar applications in all classes of concrete also in cracked concrete
- High chemical resistance, extended Potlife. Can also be used in seismic zones, fire resistant tests available.
- Drinking Water certified

TYPICAL DETAIL
1 Concrete substrate
2 Sika® AnchorFix®-1, 2 or 3
3 Leveling mortar: Sikadur®-41
The floor of the electric rooms was protected with Sikafl oor®-161.

The protection in the aeration and effluent tanks has been with a glass fibre reinforced system Sikagard®-63 N.

Pump stations and settlement tanks have been protected with Sika® Poxitar® F – Chemical protection.

Concrete under the settlement tanks was suffering from degradation. Exposed steel structures were corroding.

PROJECT DESCRIPTION

This is a large sewage water treatment plant with capacity to provide water to 5.2 million people, 40% of the population in Istanbul. It has 2 separate water treatment systems, which provide 840,000 m³ of clean water a day. System 1 was completed in 1998 and system 2 in 2003.

PROJECT REQUIREMENTS

The sewage treatment plant treats waste water containing the biological contamination and eutrophication. It needs to use various procedures and chemicals to make the water finally clean before going back to the city’s water supply system. The water containing structures have to survive under extremely severe conditions and resist against microbiological and chemical attack.

SIKA SOLUTION

Concrete spillings were repaired using Sika MonoTop® polymer modified patch repair mortar. Concrete was protected against chemical aggression with first a primary application of Sikagard®-720 EpoCem as temporary moisture barrier, followed by Sikagard®-2040 TH chemical resistant epoxy coating. Jointing of concrete elements was done with the chemical resistant sealant Sikaflex® PRO-3.

PROJECT DESCRIPTION

This sewage treatment plant in Wroclaw is a mechanical-biological sewage treatment plant with chemical-assisted removal of phosphorus and full sludge processing. The goal of the third phase of development and modernization of the sewage treatment plant was to increase the capacity from an average of 70,000 to 140,000 m³ per day, and to fulfill more stringent standards of water leaving the plant and entering the river stream.

PROJECT REQUIREMENTS

Settlement tanks and sludge pump stations needed to be rehabilitated. New structures needed to be built like grit chambers, primary and secondary settlement tanks, digestion chambers, sludge dehydration buildings and biomass tanks.

SIKA SOLUTION

Sika could provide a technical solution for each application:

- Preliminary and secondary settlement tank walls:
  - Sika® Repair-30 F – repair mortar and Sika® Poxitar® F – epoxy coating (3 layers)

- Preliminary and secondary settlement tank floor:
  - Sikafloor® 156 – epoxy levelling mortar and Sika® Poxitar® F – epoxy coating (3 layers)

- Top of tanks and driving range:
  - Sika® Elastomastic® TF – 3 mm highly chemical and mechanical resistant epoxy polyurethane hybrid and Sikaflex® PRO-3 – chemical resistant polyurethane sealant

- Pumping Station:
  - Sika® Repair-30 F – as levelling mortar and Sika® Poxitar® F – epoxy coating (3 layers)

- Digestion chambers:
  - Sika® Repair-30 F – as levelling mortar and Sika® Poxitar® F – epoxy coating (3 layers - laminated)

PROJECT DESCRIPTION

The two primary settlement tanks and the mechanical scraper tracks were in need of immediate refurbishment. Concrete under the settlement tanks was suffering from decays. The mechanical scraper tracks were subjected to heavy abrasion. Exposed steel structures were corroding.

SIKA SOLUTION

Sika could provide a technical solution for each application:

- Settlement tanks:
  - Concrete repair: Sika® MonoTop®-601 Neu – exposed steel protection
  - Sika® MonoTop®-602 / 603 Neu – polymer modifier repair mortar
  - Sika® Icoment®-520 – Resurfacing mortar
  - Sika® Poxitar® F – Chemical protection

- Scraper track refurbishment:
  - Sikafloor®-156 – Epoxy primer
  - Sika® Elastomastic® TF – wear resistant, crack bridging polyurethane epoxy resin

- Steel work:
  - Sikafloor®-EG System – primer, epoxy intermediate coat and polyurethane top coat

WE ARE SIKA
Sika is a specialty chemicals company with a leading position in the development and production of systems and products for bonding, sealing, damping, reinforcing and protecting in the building sector and the motor vehicle industry. Sika’s product lines feature concrete admixtures, mortars, sealants and adhesives, structural strengthening systems, industrial flooring as well as roofing and waterproofing systems.
